What You Need to Know About Youth and Marijuana

Kentucky

WHAT IS MARIJUANA?
Marijuana refers to the extracts or dried leaves, flowers, stems and seeds of the cannabis plant. The plant is made up of more than 100 different compounds, or cannabinoids, like tetrahydrocannabinol (THC) and cannabidiol (CBD). It is also called cannabis, weed, pot, or bud – see the U.S. Drug Enforcement Administration (DEA) Report for more street names.

WHAT ARE THE MARIJUANA LAWS IN KENTUCKY?*
Marijuana use by youth under age 21 is illegal in Kentucky and every state, unless it has been recommended by a medical provider and the appropriate certification has been obtained. There is more information about the policies in Kentucky at National Conference of State Legislatures. Additional resources can be found on the Cannabis Resource Center webpage.

How many young people in Kentucky use marijuana?

In 2021, 11.9% OF HIGH SCHOOL AGED YOUTH in Kentucky had used marijuana one or more times in the previous 30 days. Current adolescent marijuana usage data can be found in the most recent release of the Centers for Disease Control and Prevention’s annual Youth Risk Behavior Survey.

HOW DO PEOPLE USE MARIJUANA? WHAT ARE THE DIFFERENT PRODUCTS?
Marijuana and its oils and concentrates can be consumed in a variety of ways, including by smoking (e.g., joints, bowls, bongs, blunts), vaping (e.g., electronic vaporizing devices like e-cigarettes, vape pens), eating (e.g., cookies, chocolate, candies), drinking (e.g., soda, coffee, tinctures) and dabbing (through a dab rig). Currently, there is not enough research to suggest that one way of consuming marijuana is safer than another. Each method has different public health and safety risks and all can be harmful to youth brain development.

DOES MARIJUANA AFFECT THE BRAIN?
Yes, marijuana use directly affects the brain – specifically the parts responsible for:

- Memory
- Learning
- Attention
- Decision-making
- Coordination
- Emotions
- Reaction time

When people begin using marijuana during their youth, especially with regular or heavy use, there is increased risk for impairments in brain development and attention, memory and learning. These deficits may be long-lasting and can affect how youth perform in school.

WHAT ARE THE OTHER HEALTH EFFECTS OF MARIJUANA?

Marijuana can cause:

- Impairments in coordination and reaction time leading to increased risk for motor vehicle crashes and other injuries.
- Increased risk of depression and anxiety.
- Long-term physical and behavioral effects, including increased risk of schizophrenia and other psychoses.
- Increased risk of suicide.
- Chronic bronchitis from smoking marijuana.

How marijuana affects a person depends on several factors, including the amount of THC in the marijuana, how often it is used, genetics, the age of first use and whether other substances like tobacco and alcohol are used at the same time.

HOW DO I KNOW IF A YOUNG PERSON HAS A CANNABIS USE DISORDER?

Some people who use marijuana may develop cannabis use disorder (CUD). The risk of developing CUD is higher in people who started using marijuana as a youth and who use marijuana very frequently. Some signs of CUD include craving marijuana, using more than intended, needing to use more to get the same high and using marijuana even though it causes problems at home, school or work and with relationships.

People with CUD are at risk for other issues, such as attention, memory and learning problems. Research is still underway to fully understand the health effects of marijuana.
